Section A				
1		Call the numbers n, $n+1$ and $n+2$ At least one of the numbers is even, and so the product is a multiple of 2. If n is a multiple of 3 then so is the product. If $n = 3k + 1$ then $n + 2$ is a multiple of 3 If $n = 3k + 2$ then $n + 1$ is a multiple of 3. n must have one of the forms $3k$, $3k + 1$ or $3k + 2$. Therefore whichever it is one of the three numbers is a multiple of 3 and so the product is a multiple of 3. Since it is also a multiple of 2 it is a multiple of 6. 	(i) (B)		The transformation is a reflection in the y-axis.	B1 B2 **3**	same shape Inversion
	(i) (C)		The transformation is a translation of 2 units parallel to the x-axis, ie $\begin{pmatrix} 2 \\ 0 \end{pmatrix}$	B1 B2 **3**	Same shape Moved 2 to the right
	(ii)	There is a set of values of y (for example, $y = 1$) for which there are three corresponding values of x (so an inverse would be multivalued).		B1 B1 **2**	
	(iii)			B1 **1**	
	(iv)	$\mathrm{f}(x) = x^2(x+2)$ $\Rightarrow \mathrm{f}'(x) = 3x^2 + 4x$ So the gradient at (1,3) is 7. The gradient on the inverse (which is a reflection of the original in $y = x$) is therefore $^{-1}/_{7}$.		M1 A1 M1 A1 **4**	
	(v)	The graph and its reflection must intersect on the axis of reflection, ie y = x, so solve $y = x,\ y = x^2(x+2)$ $\Rightarrow x = x^2(x+2)$ $\Rightarrow 0 = x(x^2 + 2x - 1)$ $\Rightarrow x = 0, -1 \pm \sqrt{2}$ The positive non-zero root is as given.		M1 M1 E1 **3**
